Letter of Introduction

We are proud to introduce a new laboratory products company, Sci-Cool, Incorporated. Sci-Cool, Incorporated was founded in January, 2003 by individuals from both the communication industry and a leading manufacturer of refrigerated laboratory equipment with over 50 years of combined experience in engineering and business management. Their individual accomplishments range from successful business start-ups to developing the first tri-gas and seamless chamber incubators, pioneering and developing the first mechanical -100° C to -150° C cryogenic freezers, to being awarded multiple patents associated with laboratory products and applications.

Our goal at Sci-Cool is to provide high-performance refrigerators and freezers to the laboratory and commercial market place, focused on product attributes important to the laboratory scientist. Each of our products has salient features useful in today's laboratory environment. To us at Sci-Cool, high performance not only means exceptional temperature control and stability, but superior product quality, outstanding customer support (both technical and general), competitive prices and on-time delivery. Our products are supported by a nationwide, rapid-response, service organization that is sensitive to the needs of today's laboratory. As an additional service to our customers and to help expedite important product decisions, we include performance graphs on all of our single-page product literature. In keeping with this business philosophy, all products are 100 percent tested and a performance graph is provided with each unit for customer validation purposes.
